Driven by quality | Proven by service

Discover the benefits of Micronised Nutrition

No Denitrification

No Leaching

NPK Exactly where you want it

What is Aquaritin 19?

On one hand, synthetic Nitrogen (N) and Phosphorus (P) fertilizers have promoted the 'green revolution' considerably raising food production and reducing hunger worldwide. On the other hand, excessive fertilizer use is known to cause a number of environmental and ecological problems, such as air pollution, soil acidification and degradation, water eutrophication, crop yield reduction and undermining sustainability of food and energy production.

Nanotechnology now offers a solution that addresses this conflict by dramatically lowering the N and P content and use rates while still delivering the results expected from conventional N and P fertilizers.

Benefits of Aquaritin 19

- Boost photosynthesis, plant and root health
- Immediate and lasting colour response
- Promote turgidity, cleaner cut and a true roll
- Enhance fertilizer, fungicide and PGR response
- Lower disease pressure
- Improve tolerance against chemical and mechanical stress
- Mitigates lower irrigation water quality

Applications

Maintenance Rate: 0.5ltr per Hectare once every week to once every two weeks on greens and once every month on fairways and sportsfields.

Recovery Rate: 1ltr per Hectare two to three times a week until desired results are achieved.
