

Aquaritin

SPARC

Nano scale all-in-one wetting agent

Aquaritin Sparc is a unique Silicon based non-ionic nano scale wetting agent, that has the ability to prevent and control localised dry spots and hydrophobic root zones.

Due to its biodegradable nature, it leaves no long term residue within the rhizosphere and root zone, having no detrimental effect on the ecosystem and biology within. Due to the nature of Aquaritin Sparc, it enhances the biology within the rhizosphere which encourages biodiversity and leads to better plant health along with tolerances of biotic and abiotic stressors.

The low application rates of up to 40 to 50 times less than some branded products make Aquaritin Sparcs unique formulation affordable for all types of surface from golf greens and bowling greens to sports pitches and outfields.

It is tank mixable with most fungicides, pesticides and fertilisers, enhancing their efficacy, though a compatibility test is advised. Aquaritin Sparc can be applied via a conventional sprayer or through an irrigation system at 0.5-1ltr per Hectare every 2-4 weeks.

In short Aquaritin Sparc will:

- Rapidly penetrates root zones
- Aids water retention around roots
- Low dosage rates = affordable treatments
- Improves efficacy of pesticides
- Helps lower pH of tank mix

Application

Application Rate

0.5lt - 1lt per Ha every 2 - 4 weeks. Water volume 500lts - 750lts per Ha

PACK SIZE:
1 litre
